

Long-Term Agentic Memory with LangGraph

Introduction to Agent Memory

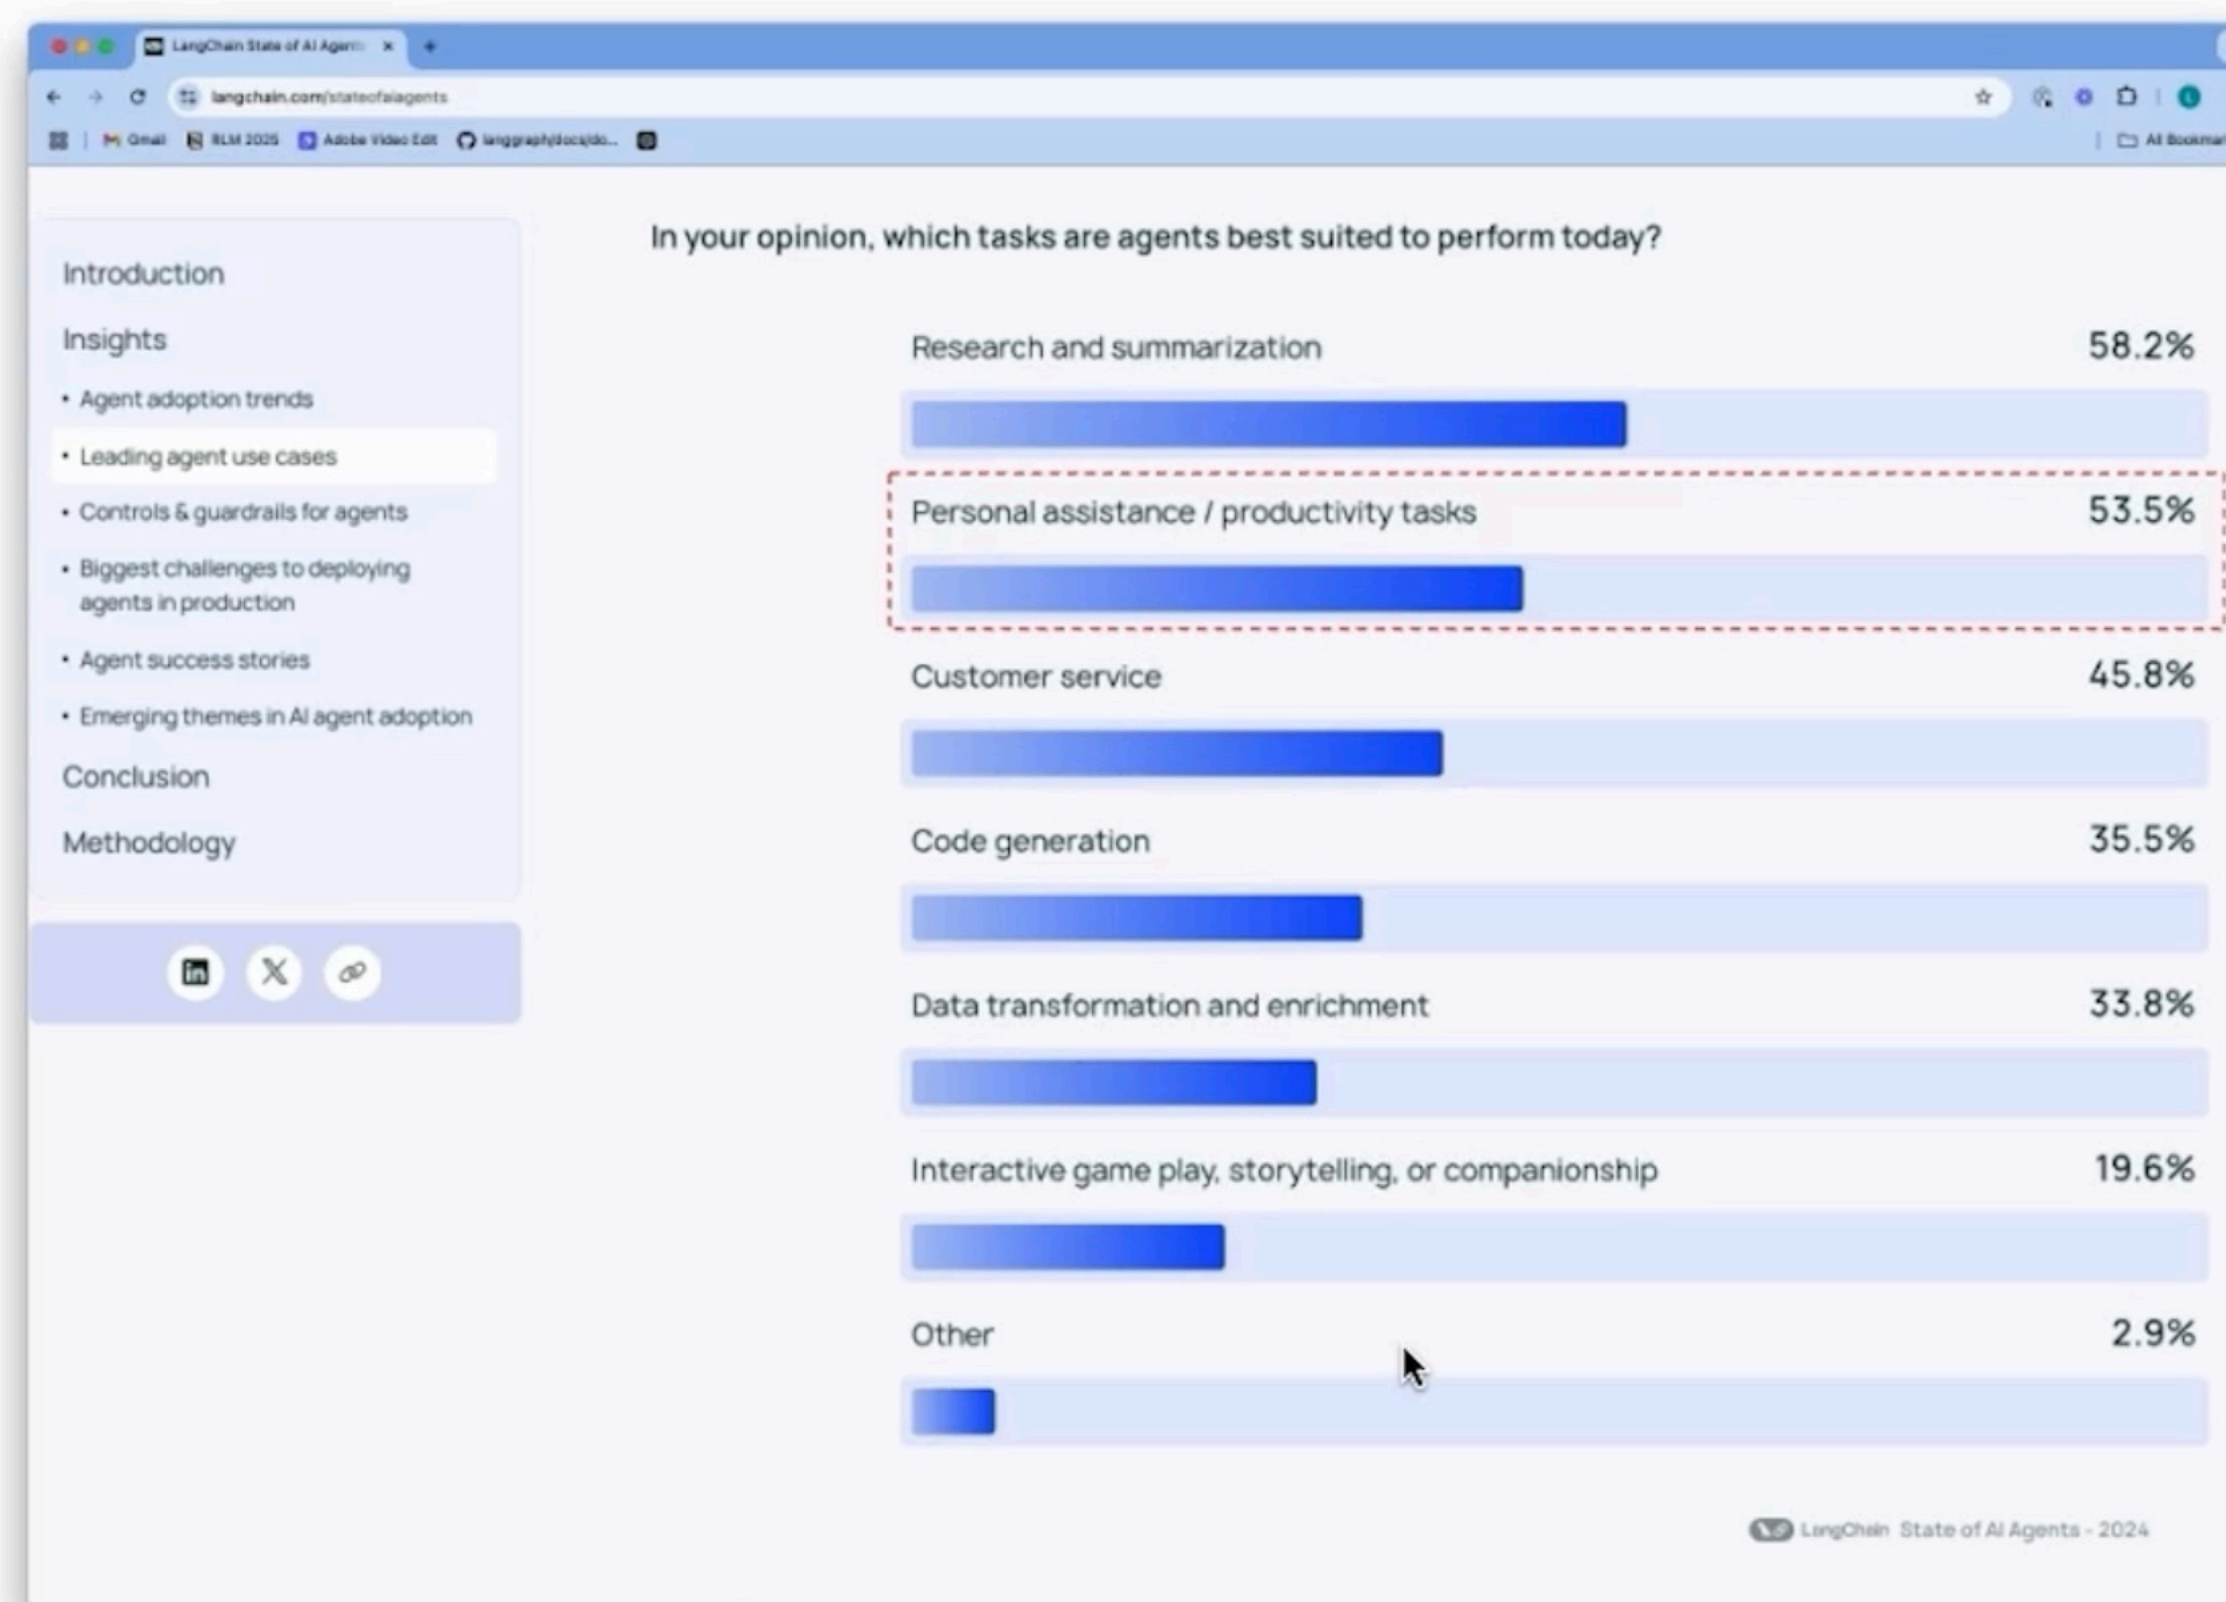

LangChain

DeepLearning.AI

Where can agents have impact?

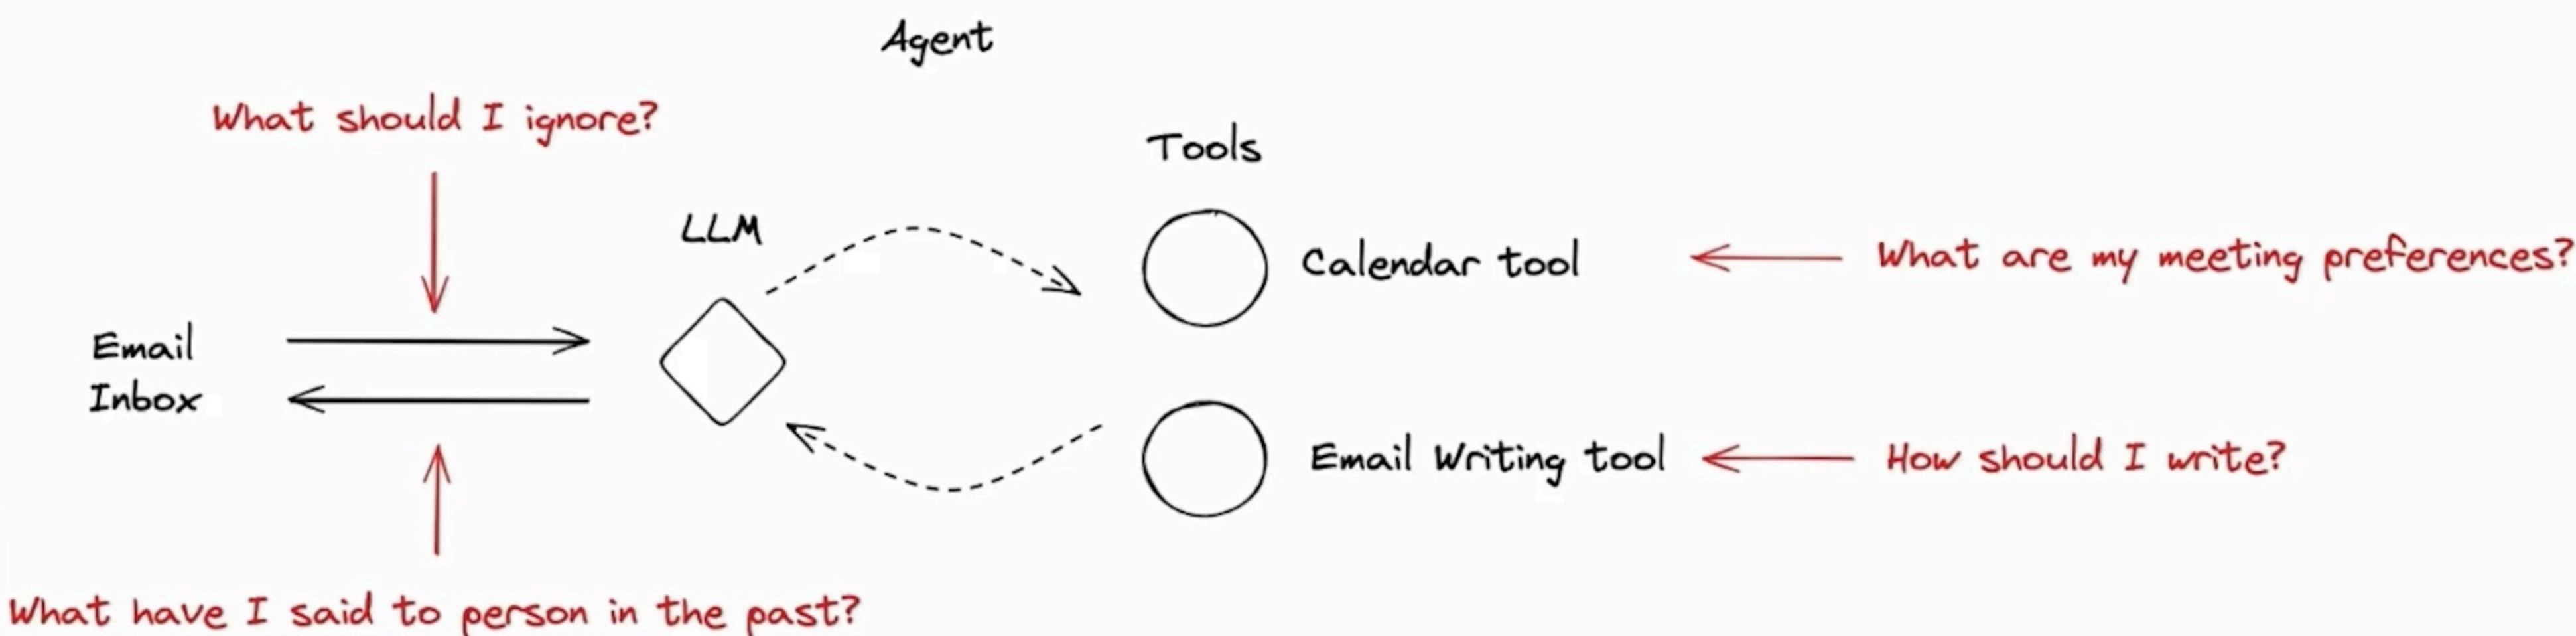

Would you give an agent access to your email?

AI assistants often need context, personalization, ability to adapt to your feedback

Maintain context over time, adapt to our preferences, learn from past interactions

What are types of memory?

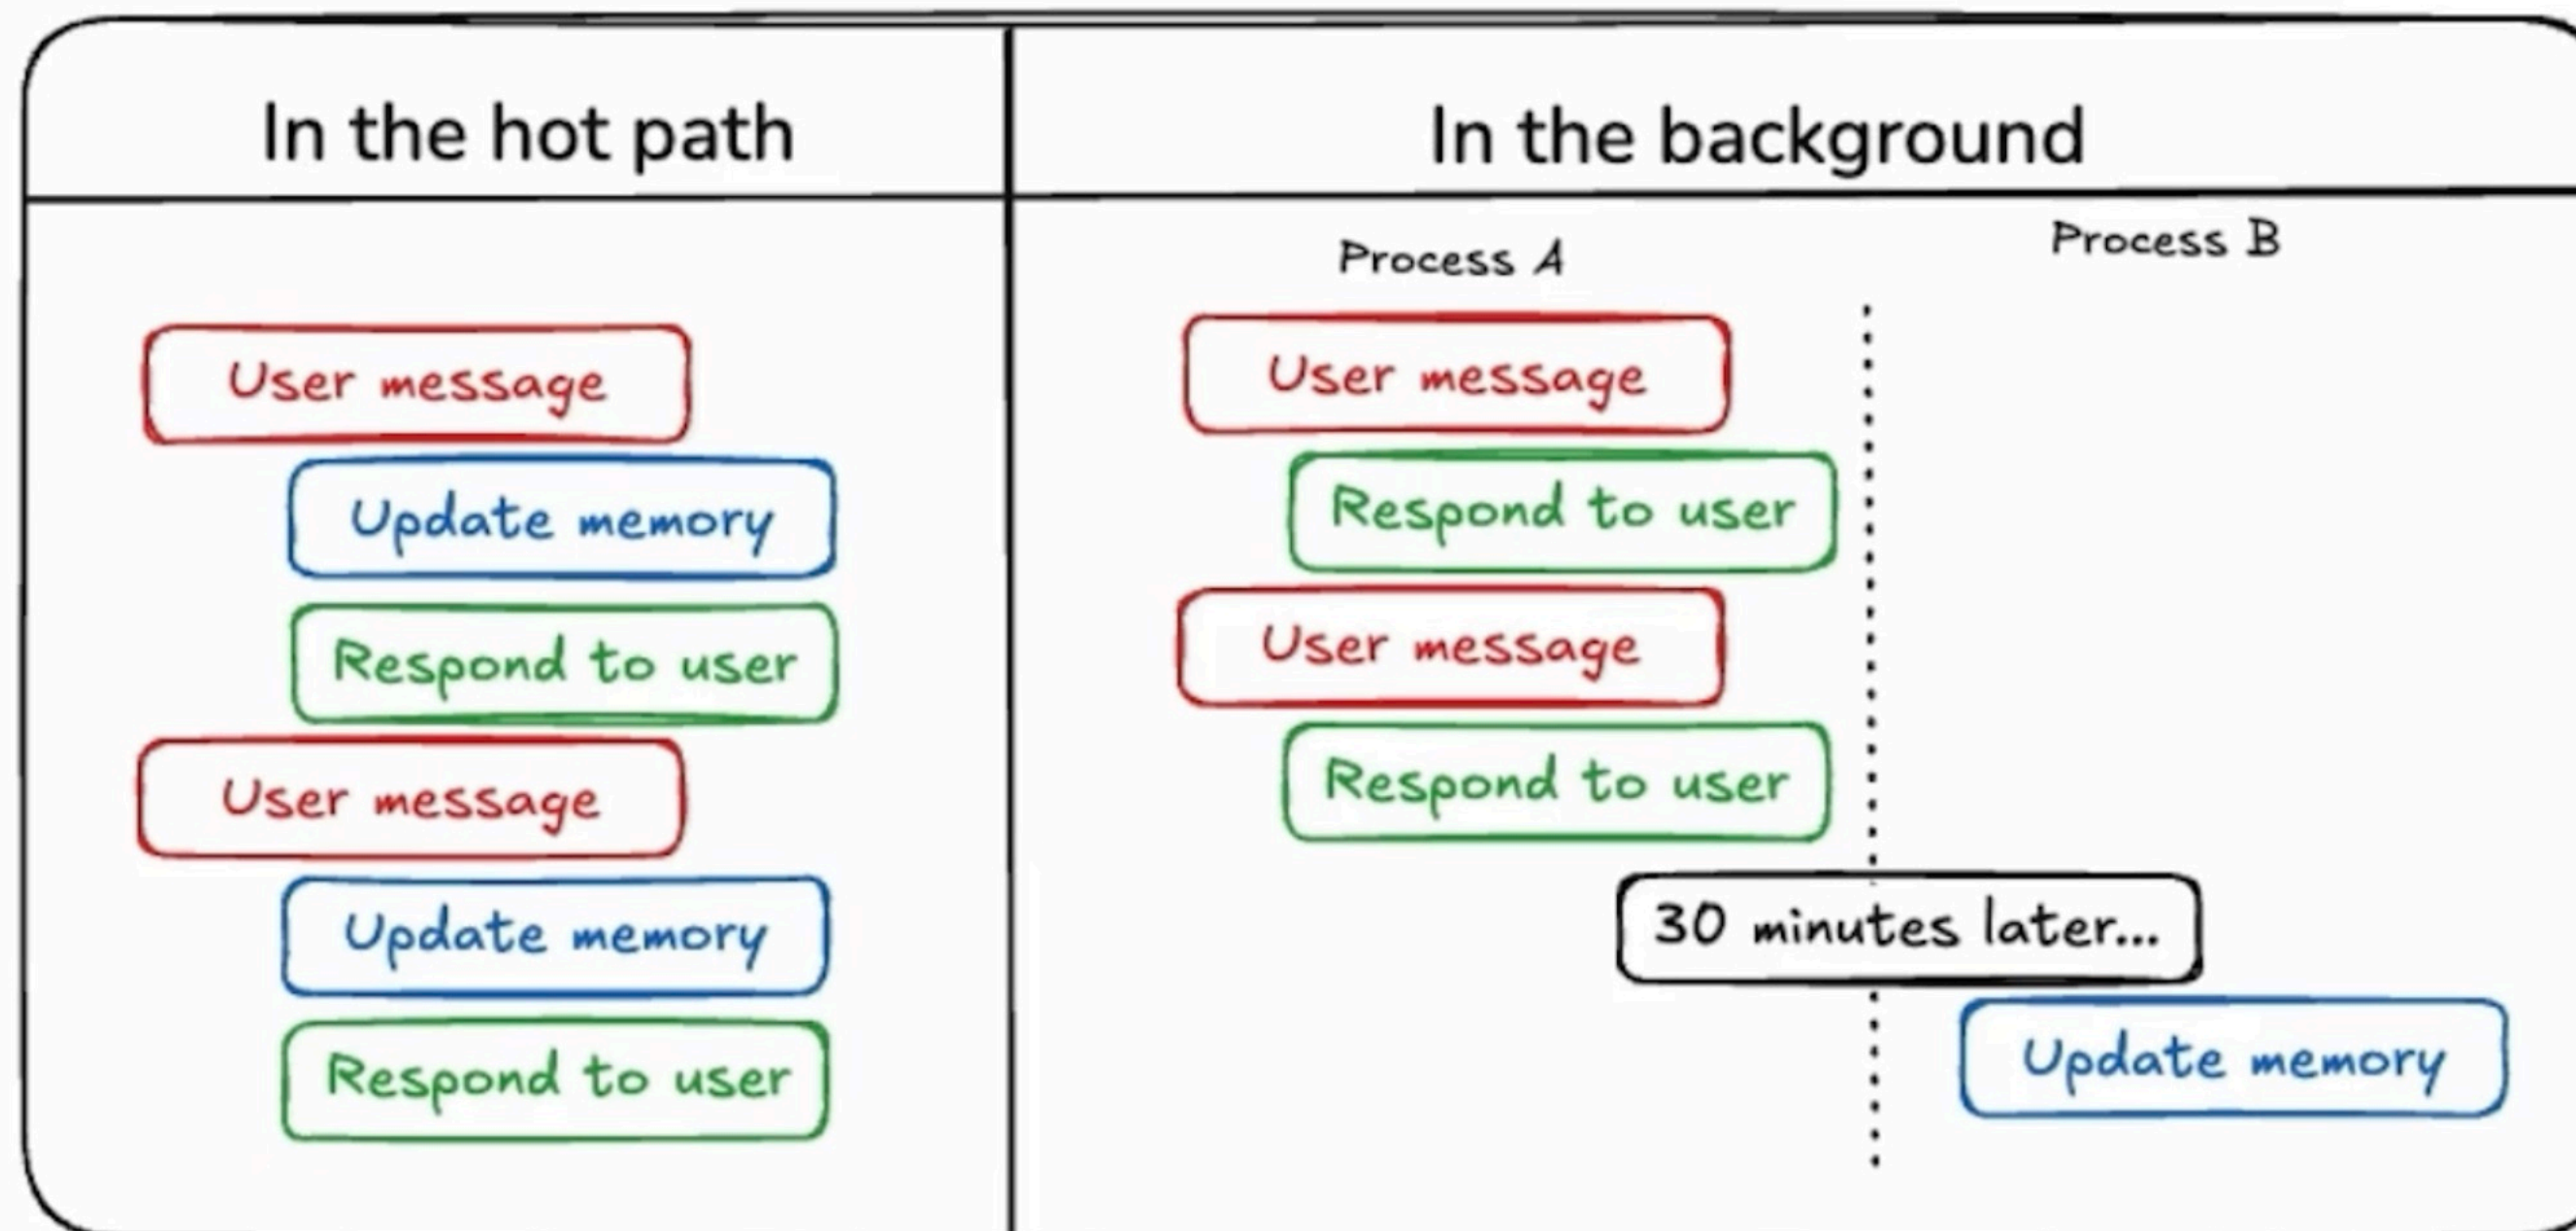

Memory Type	What is Stored	Human Example
Semantic	Facts	Things I learned in school
Episodic	Experiences	Things I did
Procedural	Instructions	Instincts or motor skills

1. Semantic memory might be about people, places, things that agent have interacted.
2. Episodic might be past agent actions, in form of few shot examples.
3. Procedural is straight forward system prompt, the instruction you give on agent how to behave.

These memory types apply to AI systems

Memory Type	What is Stored	Human Example	Agent Example
Semantic	Facts	Things I learned in school	Facts about a user
Episodic	Experiences	Things I did	Past agent actions
Procedural	Instructions	Instincts or motor skills	Agent system prompt

Memories can be saved using different mechanisms

Updates happens in background or in a separate process.

Responds faster

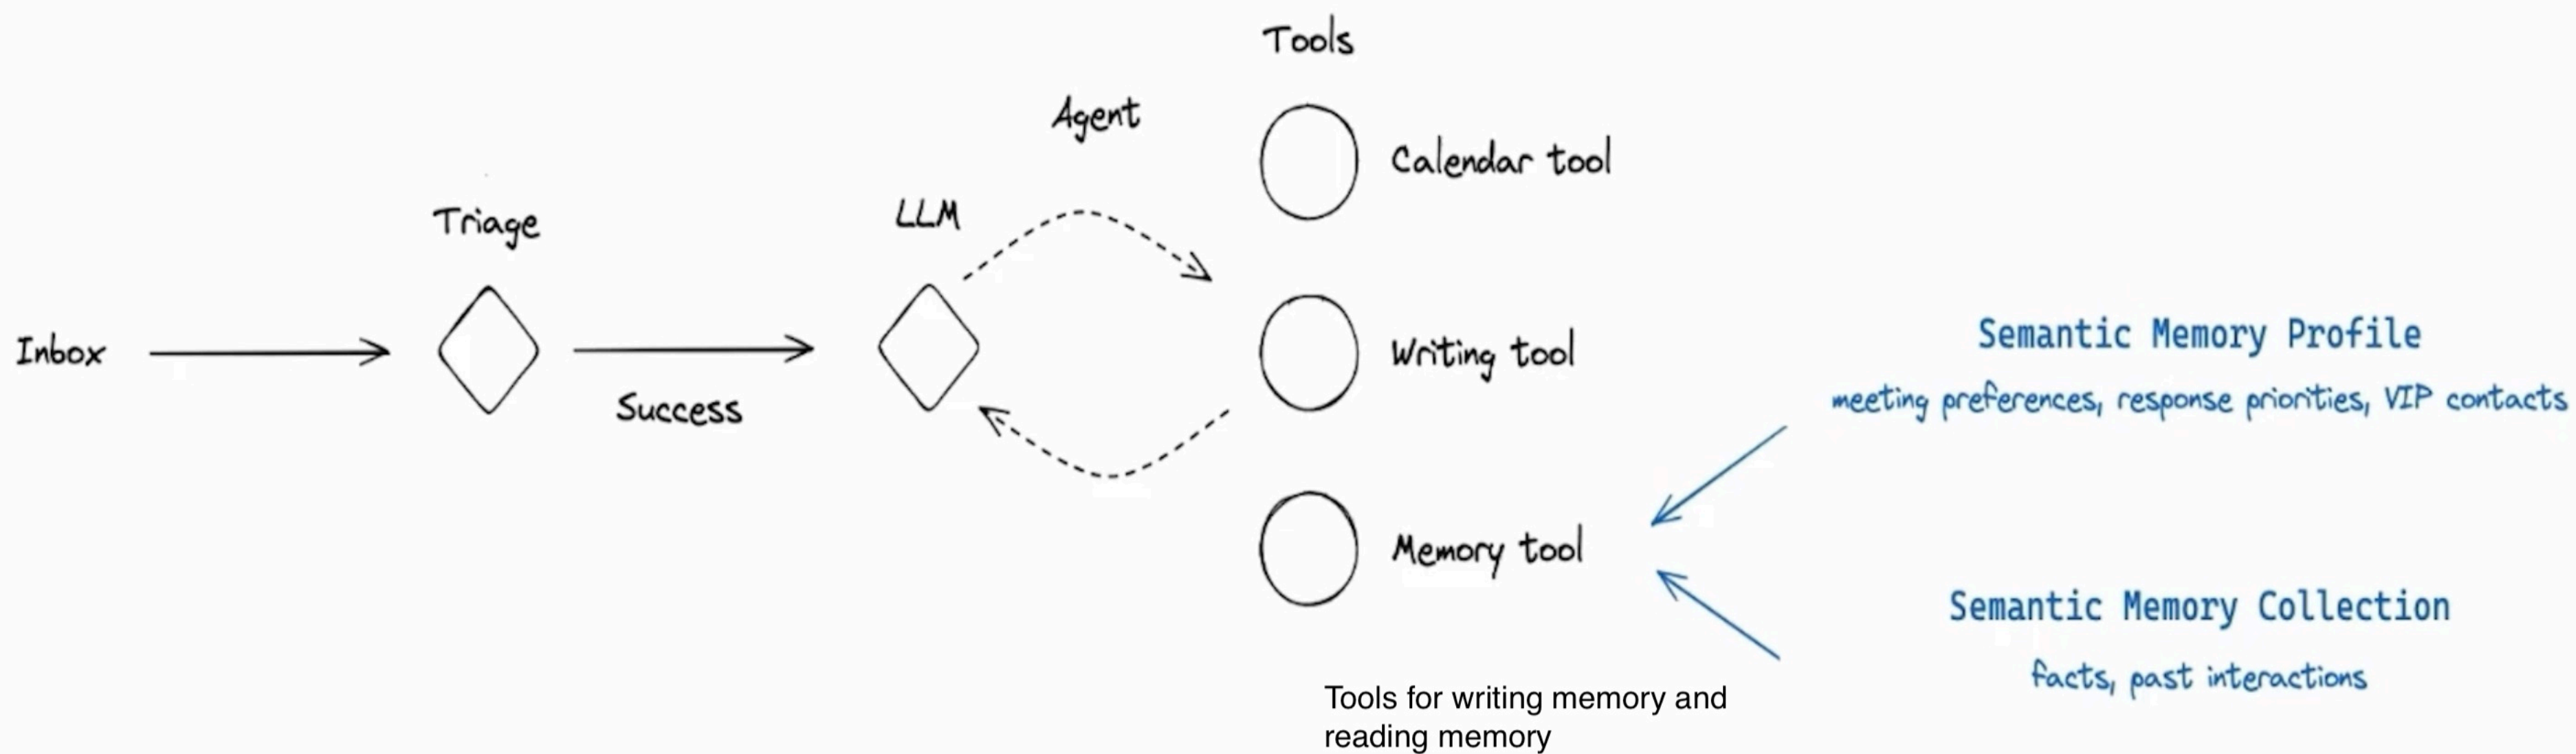

2 agents instead. Updates might not happen simultaneously, only when updated memory is scheduled.

In the Hot path Agent updates Memory as it's responding to the user

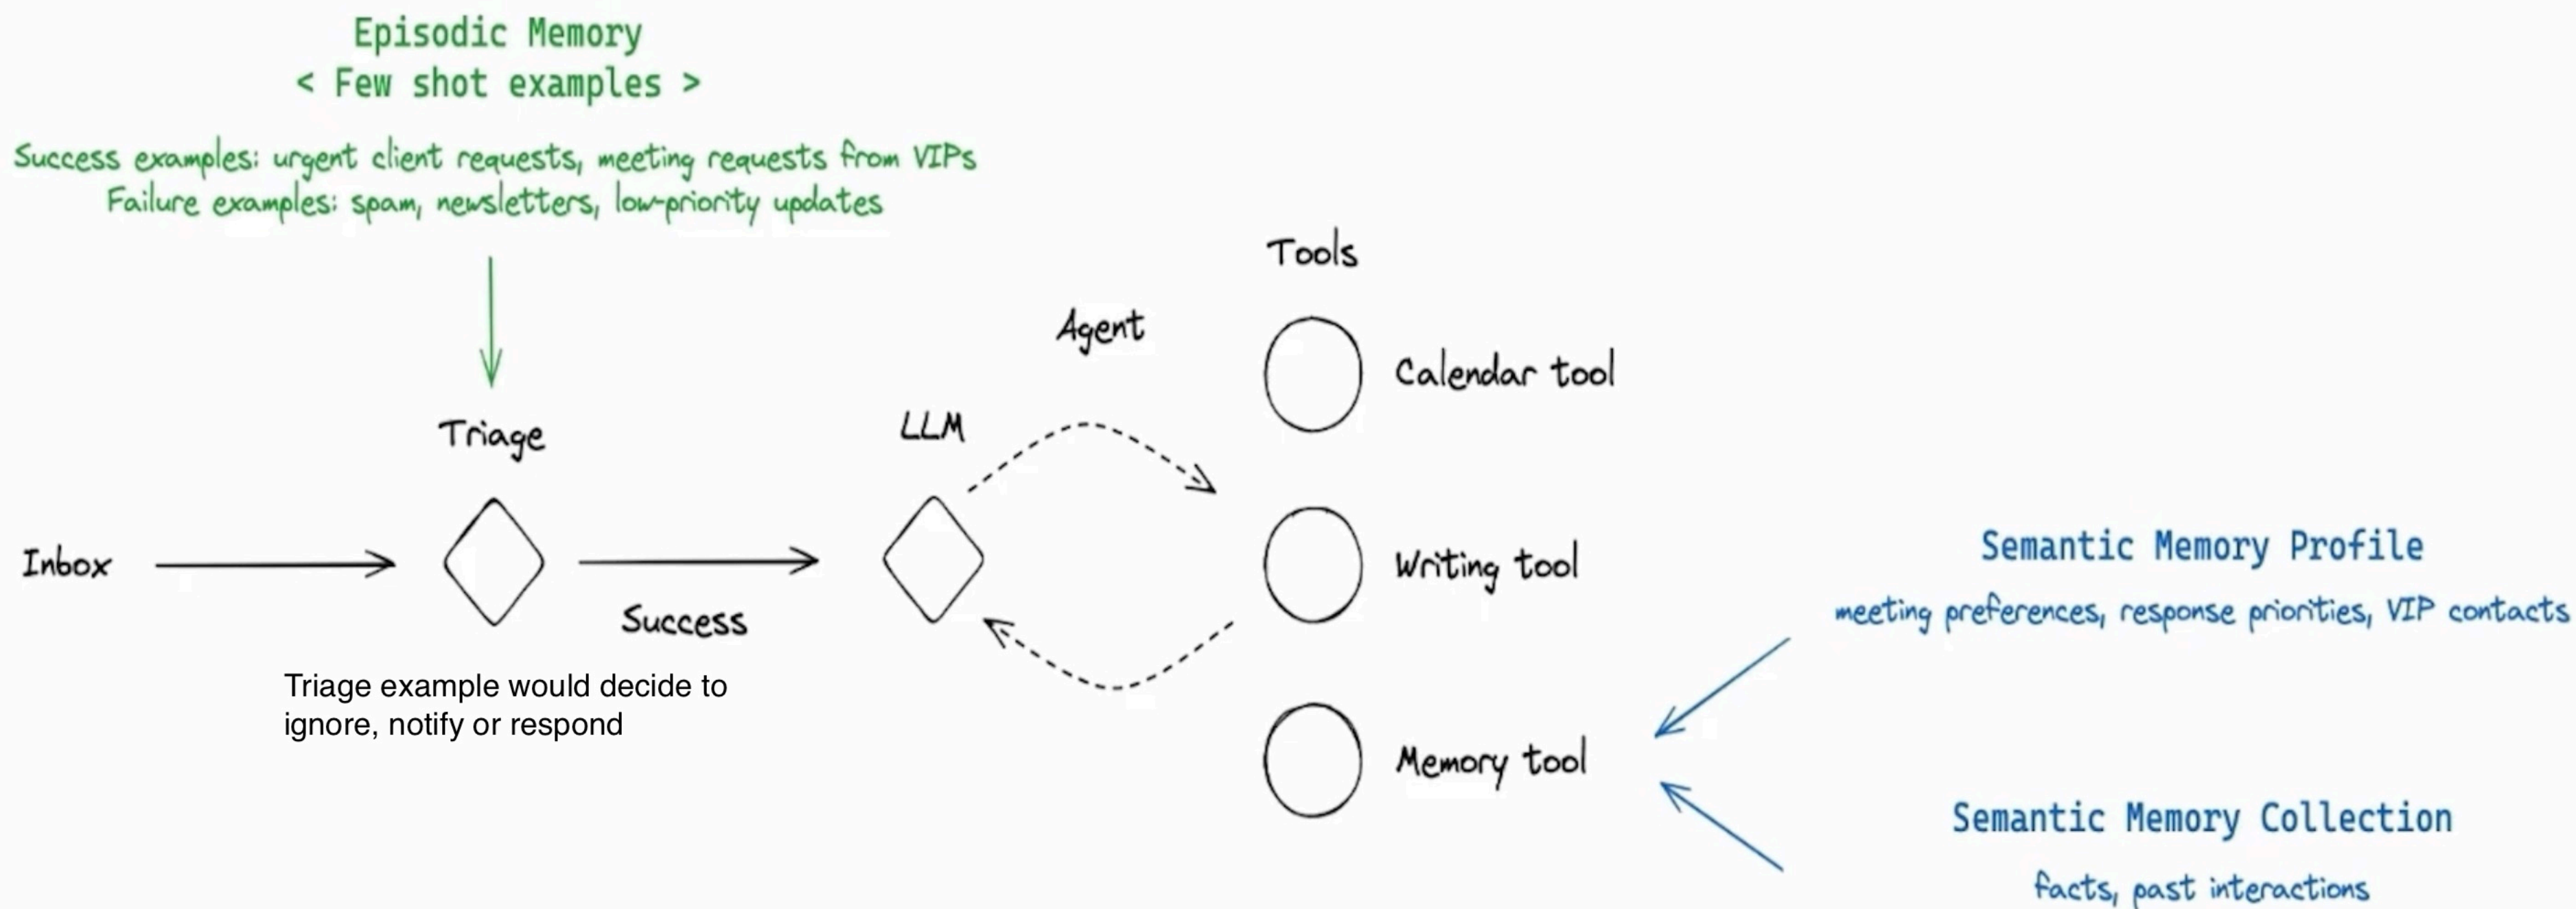

We generally have one agent.

It has additional latency when responding to the users

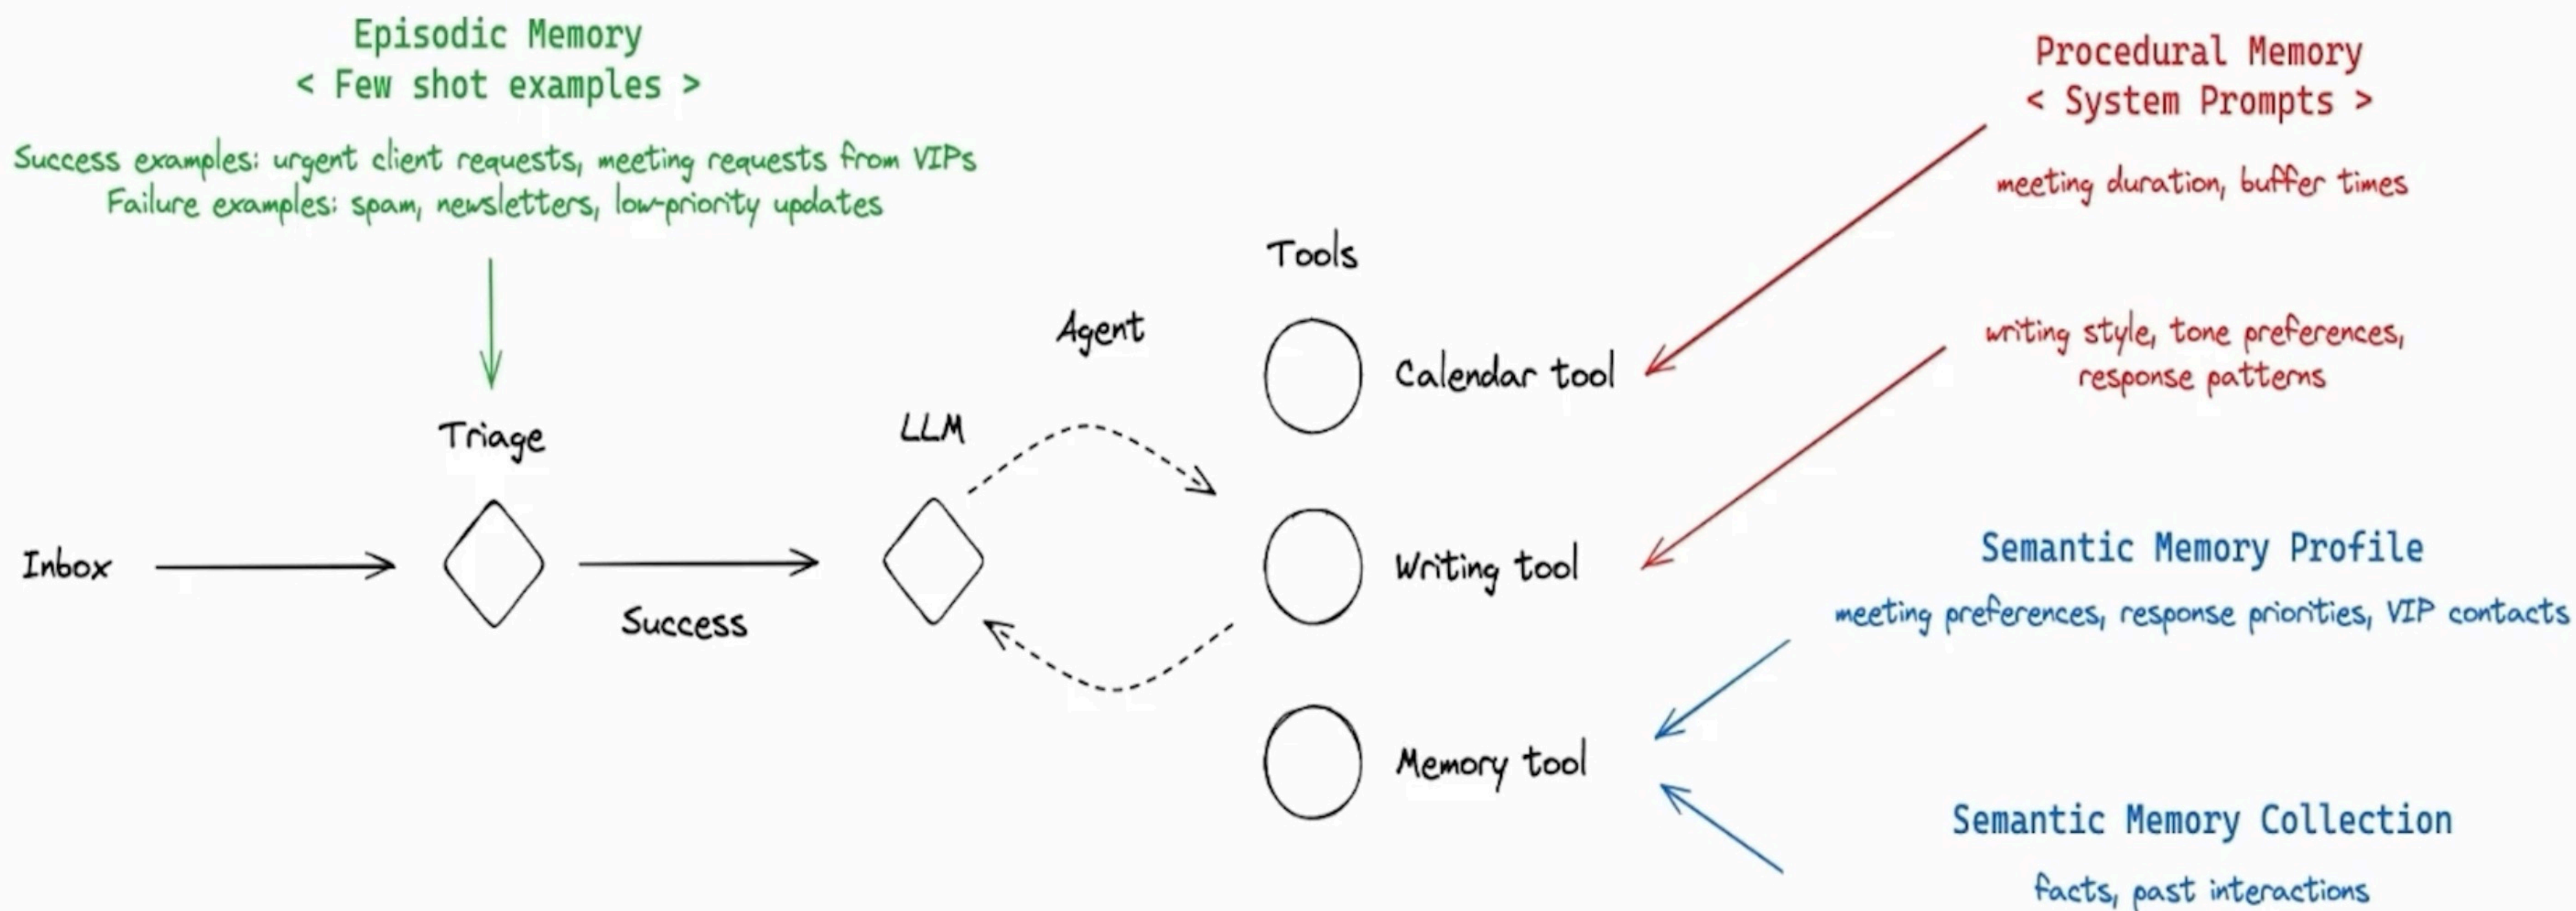

... first, we'll add semantic memory

... then, we'll add episodic memory

... finally, we'll add procedural memory

You will learn how to embed memory to most agents you are building

Long-Term Agentic Memory with LangGraph

Email Assistant with
Semantic + Episodic Memory

... next, we'll add episodic memory

Episodic Memory
< Few shot examples >

Success examples: urgent client requests, meeting requests from VIPs
Failure examples: spam, newsletters, low-priority updates

Long-Term Agentic Memory with LangGraph

Email Assistant with
Semantic + Episodic + Procedural
Memory

... next, we'll add episodic memory

... finally, we'll add procedural
memory
